

DIFFERENCES BETWEEN THE INTERNET AND LIBRARY DATABASES

Exploring The Differences: The Internet is a worldwide collection of computer networks providing many differing types of information. Some sites are for entertainment; some are for academic research. Others may be commercial or personal opinions, and some even intentionally give out false information. Anyone can publish anything, whenever they want. You will find some information free and sometimes you will be required to register or pay a fee. Searching the Internet is like sticking your hand in a "grab bag" of information -- sometimes all you get is junk, while at other times you will discover the exact fact you need for your assignment.

The databases are an information service provided to you as a student at Miami Dade College. The college pays for you to be able to access these services both on and off campus. These databases include thousands of magazines, scholarly journals and some reference books. It is important to realize that the databases **are not** the Internet. Even though you access the databases using an Internet browser, you are not searching the "open" Internet. If your instructor states that you can only use one Internet source, the database articles **should not** count as that Internet source. To find the databases available to you, visit the Kendall Campus Library home page (www.mdc.edu/kendall/library) and click Find Articles.
